

SAFE 441 BROWARD

US 441 Safety Demonstration Corridor Proposal

Proposed Corridor

US 441 / State Road 7 between Sheridan Street and Griffin Road, with initial attention on the intersections at Sheridan Street, Stirling Road, and Griffin Road.

The Problem

US 441 is one of Broward County's most important commercial, transportation, and transit corridors. Thousands of residents, employees, customers, drivers, transit riders, pedestrians, and cyclists use it every day.

The corridor also presents serious safety challenges, including high vehicle speeds, long pedestrian crossings, heavy turning traffic, difficult access to bus stops, limited pedestrian protection, nighttime visibility concerns, repeated crashes, and responsibility divided among multiple government agencies.

Residents and businesses should not have to wait for more serious injuries or deaths before coordinated action is taken.

Our Request

Safe 441 Broward asks FDOT District 4, Broward County, the Broward Metropolitan Planning Organization, Broward County Transit, the City of Hollywood, the Town of Davie, and relevant public-safety agencies to establish a joint US 441 Safety Demonstration Corridor.

We respectfully request that the participating agencies:

1. Conduct a formal Road Safety Audit of US 441 between Sheridan Street and Griffin Road.
2. Review and publish relevant crash, speed, pedestrian, transit, lighting, signal, roadway-access, and near-miss information.
3. Identify at least ten practical safety improvements that can be installed, initiated, or designed within twelve months.
4. Develop focused safety concepts for the intersections at Sheridan Street, Stirling Road, and Griffin Road.
5. Evaluate pedestrian crossing protection, signal timing, lighting, bus-stop access, turning conflicts, driveway access, speed management, and modern near-miss detection technology.

6. Assign a lead agency and named project manager responsible for coordinating the participating governments.
7. Publish an implementation schedule, potential funding sources, and measurable before-and-after safety results.

Potential Improvements to Evaluate

The Road Safety Audit should consider proven and emerging safety measures, including:

- Leading pedestrian intervals
- Protected turning phases
- Pedestrian hybrid beacons
- Median refuge islands
- Improved crosswalk lighting
- Safer access to bus stops
- Speed-feedback signs
- Safe-speed signal coordination
- Driveway and median-access improvements
- Pedestrian, cyclist, and vehicle near-miss detection
- Connected-vehicle and transit safety warnings
- Improved emergency-response coordination

The final treatments should be selected through engineering review, public input, crash analysis, and measurable safety evidence.

What This Proposal Is Not

This is not a request to immediately reconstruct the entire corridor or approve one untested technology.

It is a request to formally investigate the corridor, begin practical improvements, coordinate the responsible agencies, establish measurable deadlines, and create a clear path toward reducing deaths and serious injuries.

Community Participation

Safe 441 Broward is forming a nonpartisan coalition of residents, neighborhood associations, businesses, transit riders, parents, seniors, medical professionals, public-safety professionals, transportation specialists, accessibility advocates, and people personally affected by crashes.

Our goal is to work constructively with government agencies and corridor stakeholders while maintaining public accountability throughout the process.

Requested Next Step

We ask each participating government to designate a representative for an initial joint meeting and support a formal resolution requesting the Road Safety Audit and twelve-month demonstration program.
